Puzzles**

**Peter Cave**

**OneWorld, £7.99  
(248pp, pbk)**

Should we trust politicians who cheat on their spouses? Why do religions assume the creator of the Universe is benevolent? Why shouldn't a surgeon with four dying transplant patients be allowed to kill a passer-by and strip out his organs? After all, four lives would be saved by the loss of just one, which sounds like a bargain.

If you're intrigued by questions like these, you'll love Peter Cave's collection of conundrums drawn from across the spectrum of that much-maligned academic

pursuit called philosophy. Cave – himself a philosopher – does a grand job of demonstrating the enduring relevance of the subject, as well as its ability to reveal hidden depths in the seemingly trivial. Be warned, though: if you're looking for simple yes/no answers to trot out at dinner parties, you'll be disappointed. As Cave shows, the demand for such answers is often hopelessly misplaced, not to say futile.

But with its wonderfully varied selection of topics, plus Cave's admirable lightness of touch, this is one of the most entertaining and thought-provoking books I've come across in years. So stop messing around with trivia like Sudoku and give your brain a real treat by buying this book.
